

Yellow Sea LME Project

Assessment and Fisheries Conditions

Qisheng Tang
Yellow Sea Fisheries Research Institute
Qingdao 266071, P. R. China

History and Progress of YSLME Project

The project
takes off
in 2005

■ The goals of the project

- ❑ Develop ecosystem-based, environmentally sustainable management strategies for the Yellow Sea and its watershed,
- ❑ Prepare Transboundary Diagnostic Analysis (TDA), National Yellow Sea Action Plans (NYSAPs), and Strategic Action Plan (SAP).
- ❑ Establish regional framework for cooperation

■ The strategy of the project

Four major components were developed for the project

- The first component, “Regional Strategies for Sustainable Management of Fisheries and Mariculture”,
addresses the need for sustainable fisheries management and fisheries recovery plans agreed on a regional bases.
- The second component, “Effective Regional Initiatives for Biodiversity Protection”,
addresses the need for coordinated regional action to preserve globally significant biodiversity.

- ❑ **The third component, “Actions to Reduce Stress to the Ecosystem, Improve Water Quality and Protect Human Health”,**
addresses the YSLME as a marine ecosystem, and develops management practices based on an understanding of ecosystem behavior, the very basis for the Large Marine Ecosystem Concept.
- ❑ **The fourth component, “Development of Regional Institutional and Capacity Building”,**
focuses the intervention on the required national and regional institutional and capacity building and strengthening, on the preparation of investment portfolios, and on coordination of preparation of the project.

■ The strategy of the project

The project is conducted by 5 Regional Working Groups in the implementation plan

- ❑ Fisheries
- ❑ Biodiversity
- ❑ Ecosystem
- ❑ Pollution
- ❑ Investment

5 Module for the Monitoring, Assessment and Management of LMEs

Activities in 2005-2006

- ❑ Two PSC meetings
- ❑ Two regional technical meetings
- ❑ Ten meetings of the Regional Working Groups (RWG)
- ❑ One special technical meeting for the co-operative study cruises

Yellow Sea Partnership for Public Awareness

Current Partners

Global Village of Beijing (GVB)

Korea Ocean Research and Development Institute (KORDI)

Marine Stewardship Council (MSC)

Partnerships in Environmental Management for the Seas of East Asia (PEMSEA)

The Nature Conservancy (TNC), Beijing

UNEP Regional Seas Programme Northwest Pacific Action Plan (NOWPAP)

UNDP/GEF Yellow Sea Large Marine Ecosystem (YSLME) Project

United Nations Development Programme (UNDP), China

Wetlands International (WI)

Worldwide Fund for Nature – China

Worldwide Fund for Nature – Hong Kong

Worldwide Fund for Nature – Japan

WWF/KORDI/KEI Yellow Sea Eco-Region Planning Programme (YSEPP)

Example: Parliamentary Conference

Held in Qingdao, China, 28th - 30th March 2006

51 participants, including 14 members from the parliamentary organizations, attended.

A satellite map of the Yellow Sea, showing the surrounding landmasses of East Asia and the Korean Peninsula. The sea is a deep blue, while the land is green and brown. A small blue dot marks the location of Qingdao on the coast of China.

Fisheries Conditions

Qingdao

in Yellow Sea LME

Marine fisheries production in China

Marine fisheries production in the Yellow Sea

Species composition of mariculture in the Yellow Sea

1959

1981

1986

1998

2005

Species compositions in biomass yields Yellow Sea (Spring)

**Changes in biomass yield
in the central to southern part of YS**

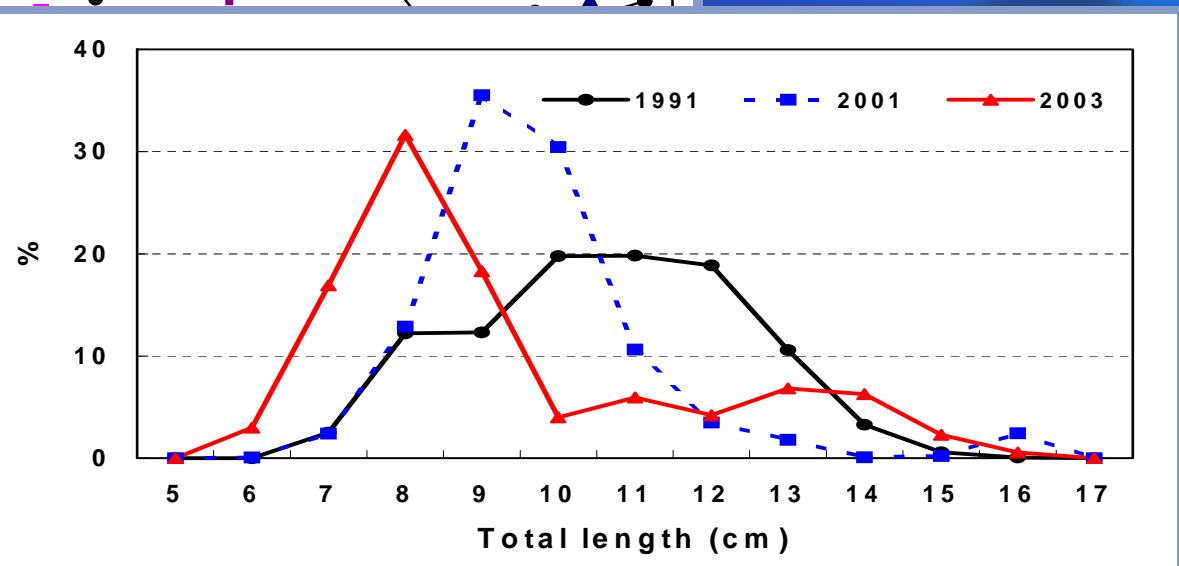

Wintering stock biomass and annual landings of the anchovy in the Yellow Sea

Decadal changes in age structure of the wintering anchovy and size structure of the spawning stock of anchovy in YS, 1986–2005

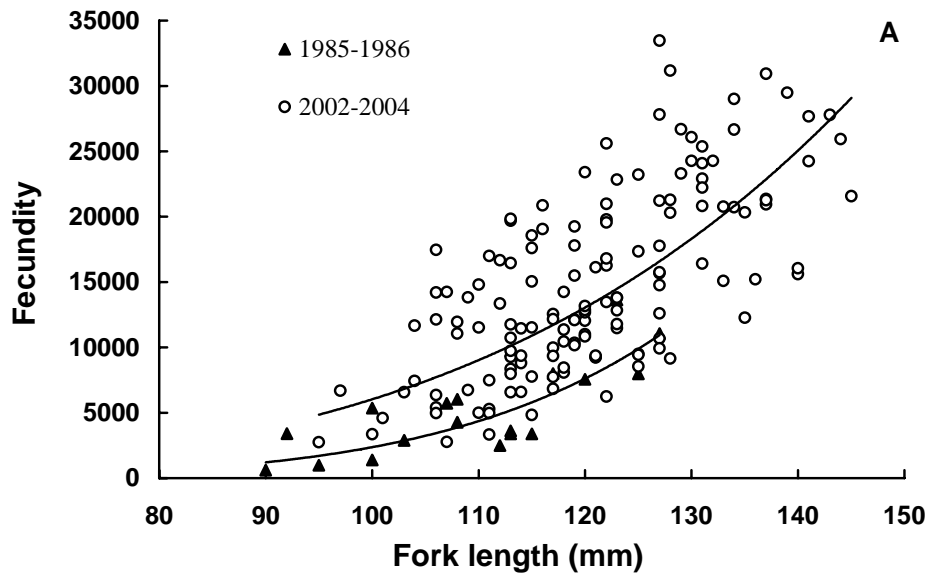

- Before 1996: Fluctuated
- After 1999: Age 1 increased, Age 2 decreased

The main component changed progressively from larger fish (10-12 cm) to smaller ones (8-10 cm)

Fecundity and its decadal changes of anchovy in the Yellow Sea

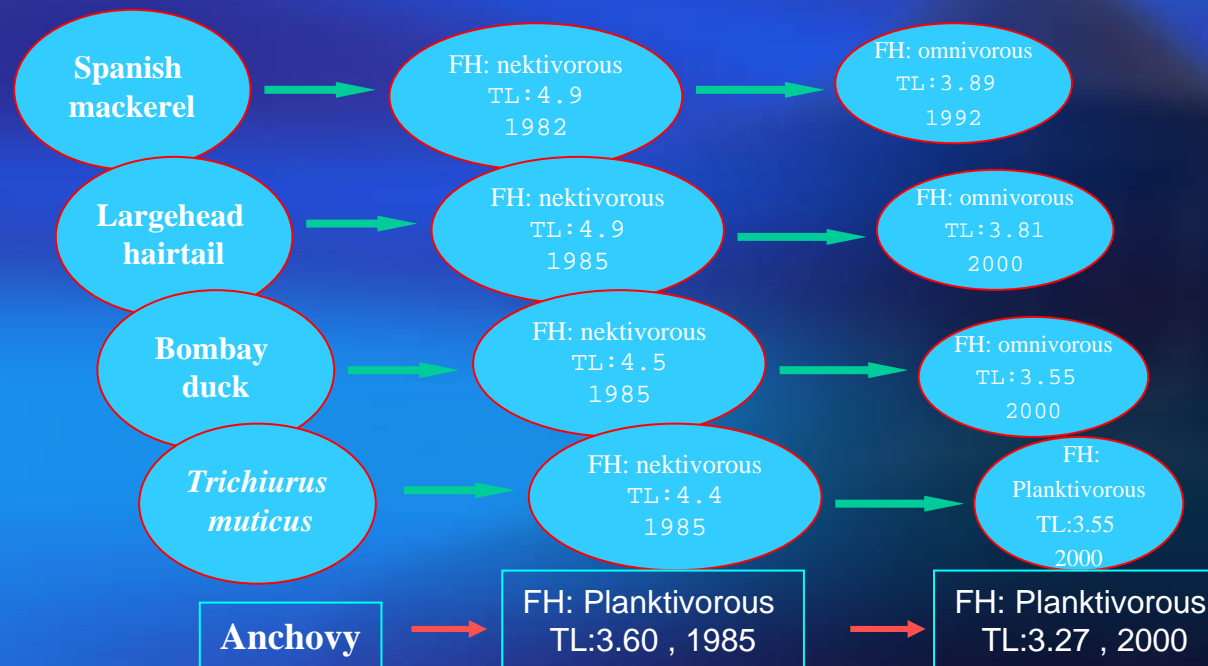

Both total (A) and relative fecundity (B) almost doubled

← Trophic level (TL) of important species declined obviously from 4.1 in 1959~60 to 3.4 in 1998~99, the Bohai Sea; from 3.7 in 1985~86 to 3.4 in 2000~01, the Yellow Sea .

Changes in feeding habits in the YS

The results indicated that feeding habits of some species changed significantly over past 20 years.

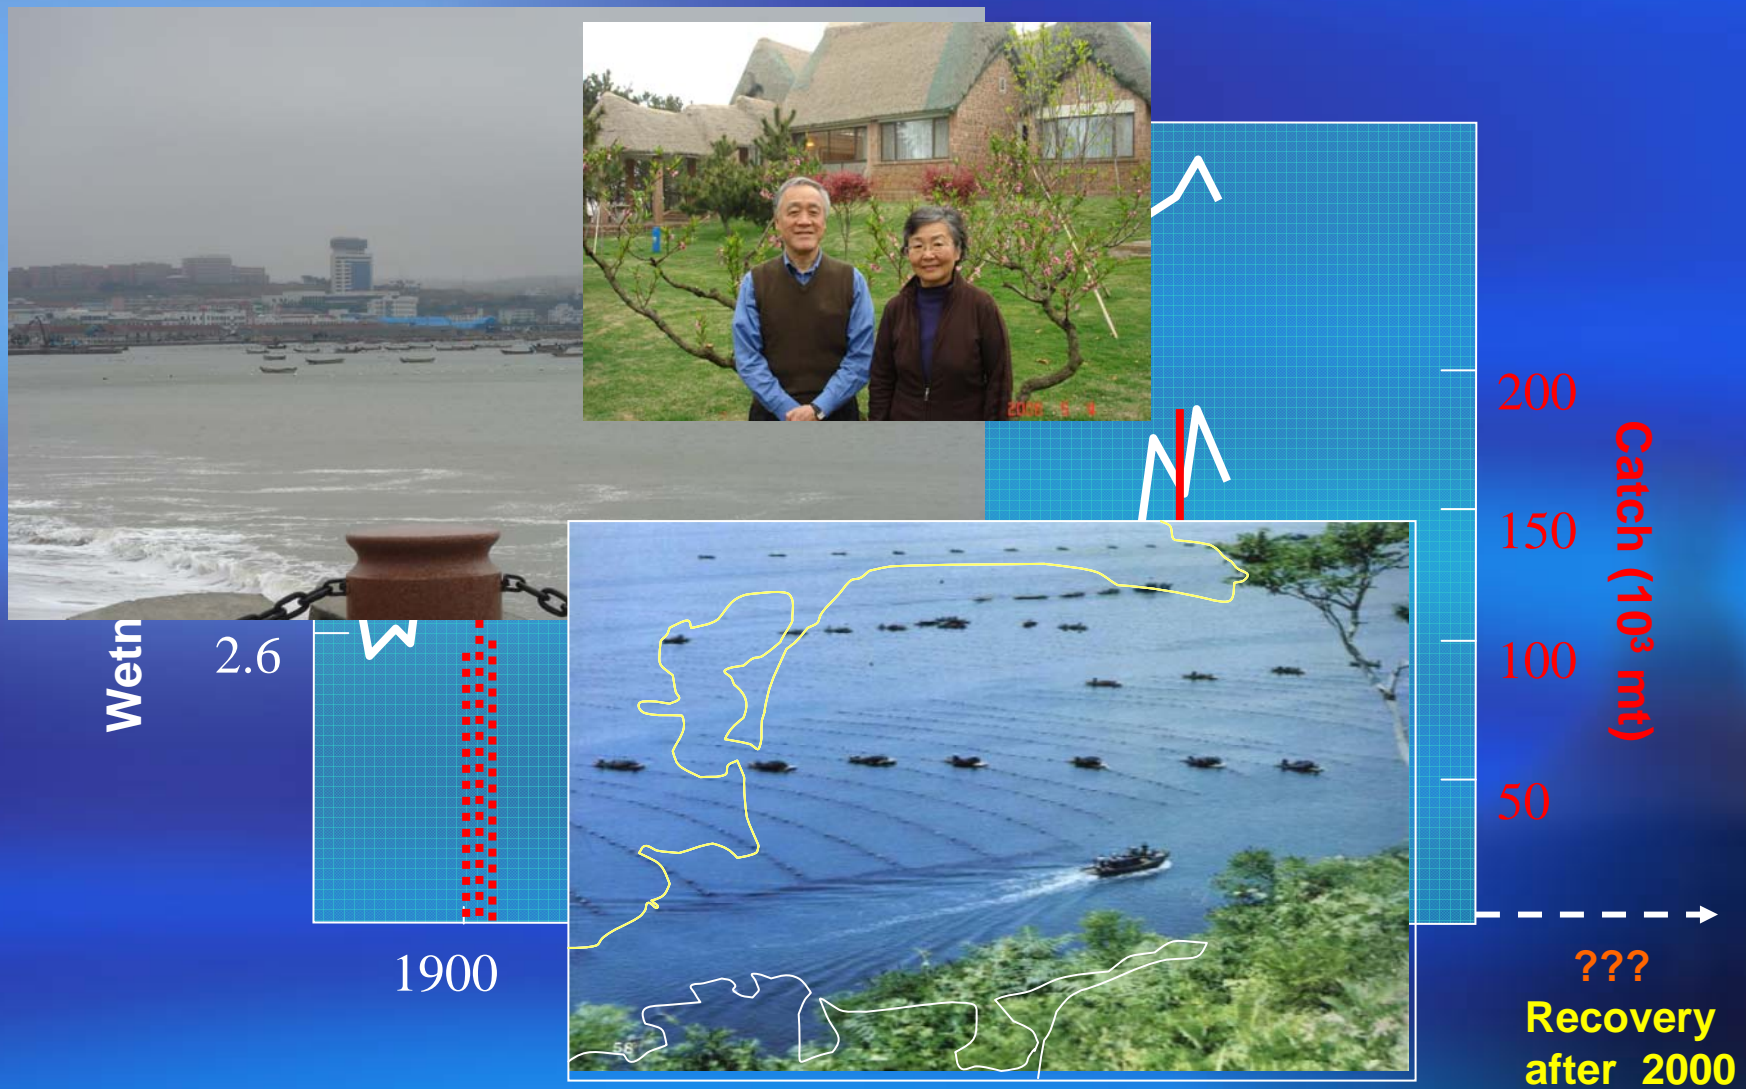

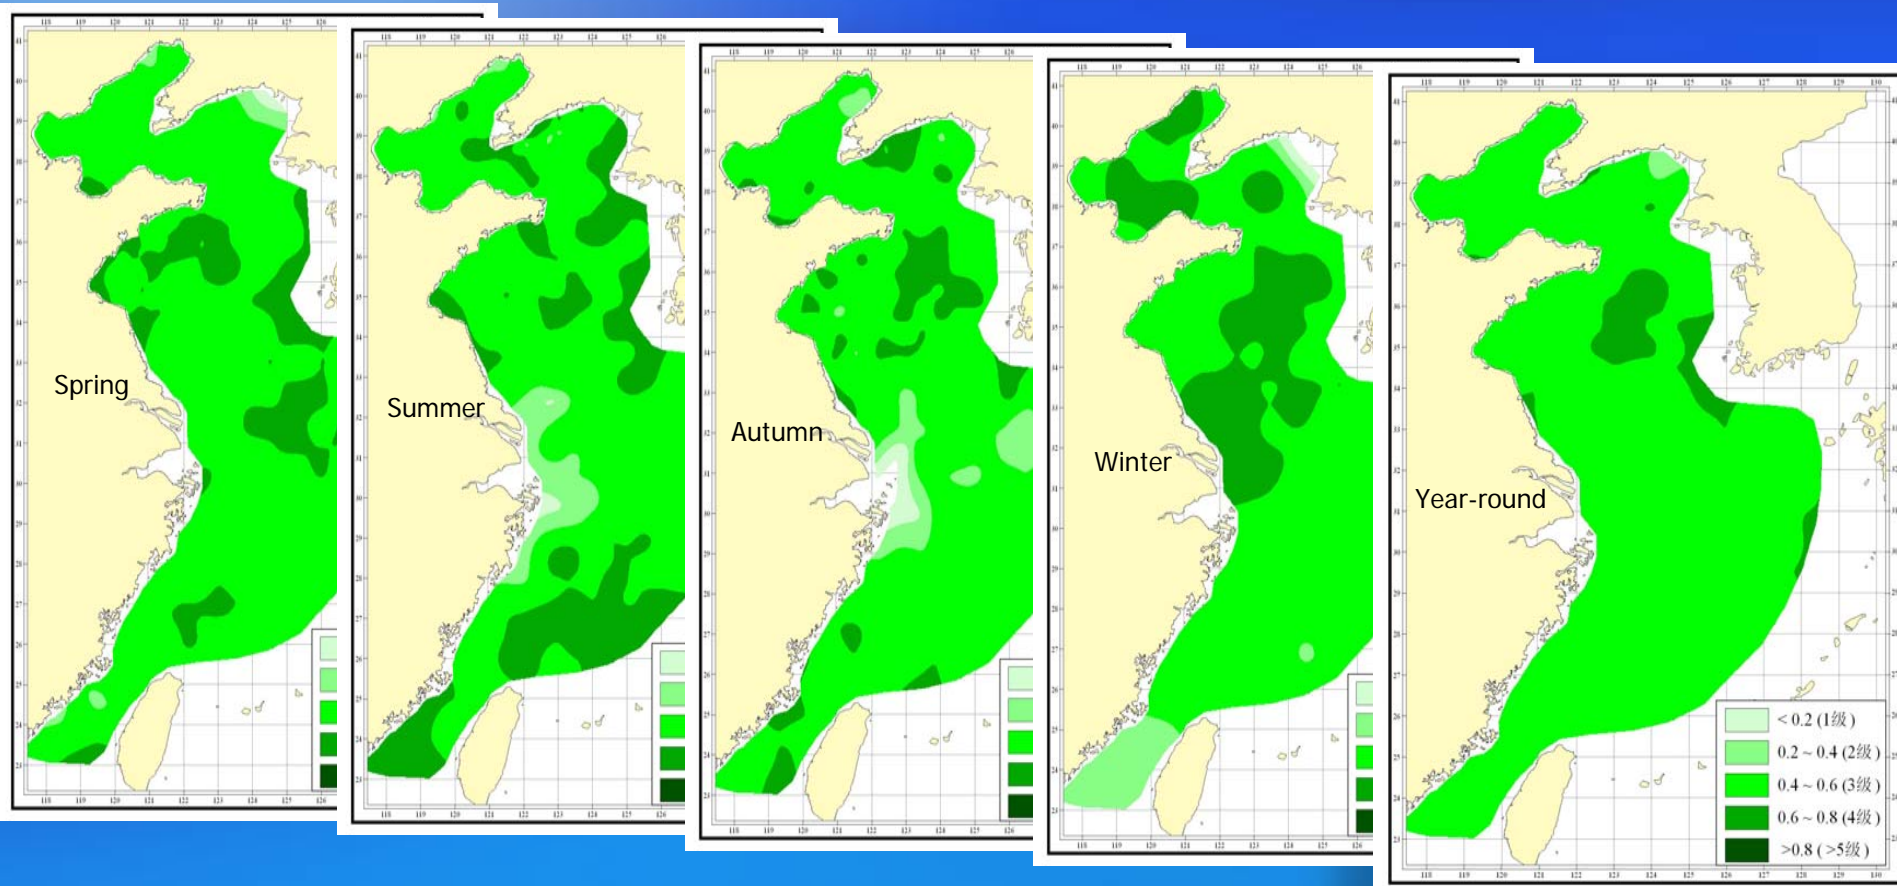

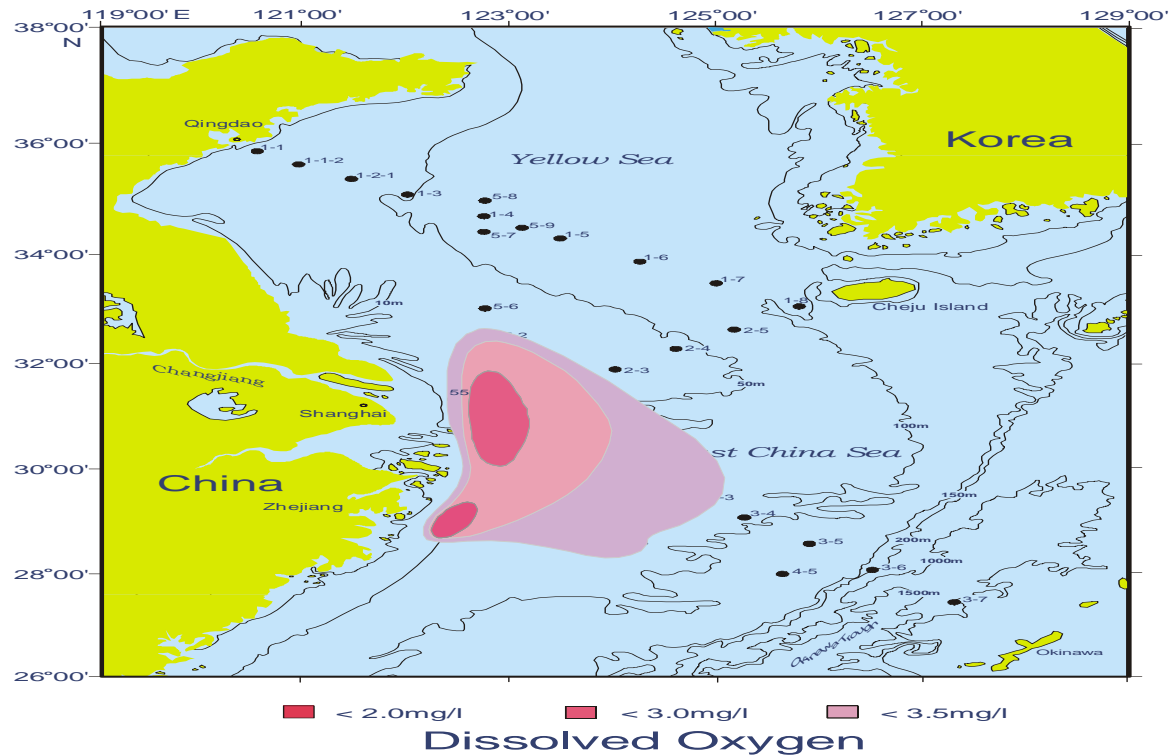

Fig. 6. Relationship between the fluctuations in herring abundance of the Yellow Sea and the 36-yr cycle of wetness oscillation in eastern China. (adapted from Tang, 1981)

Nutrient condition (environmental quality) of marine fisheries waters in the Yellow Sea and the East China Sea

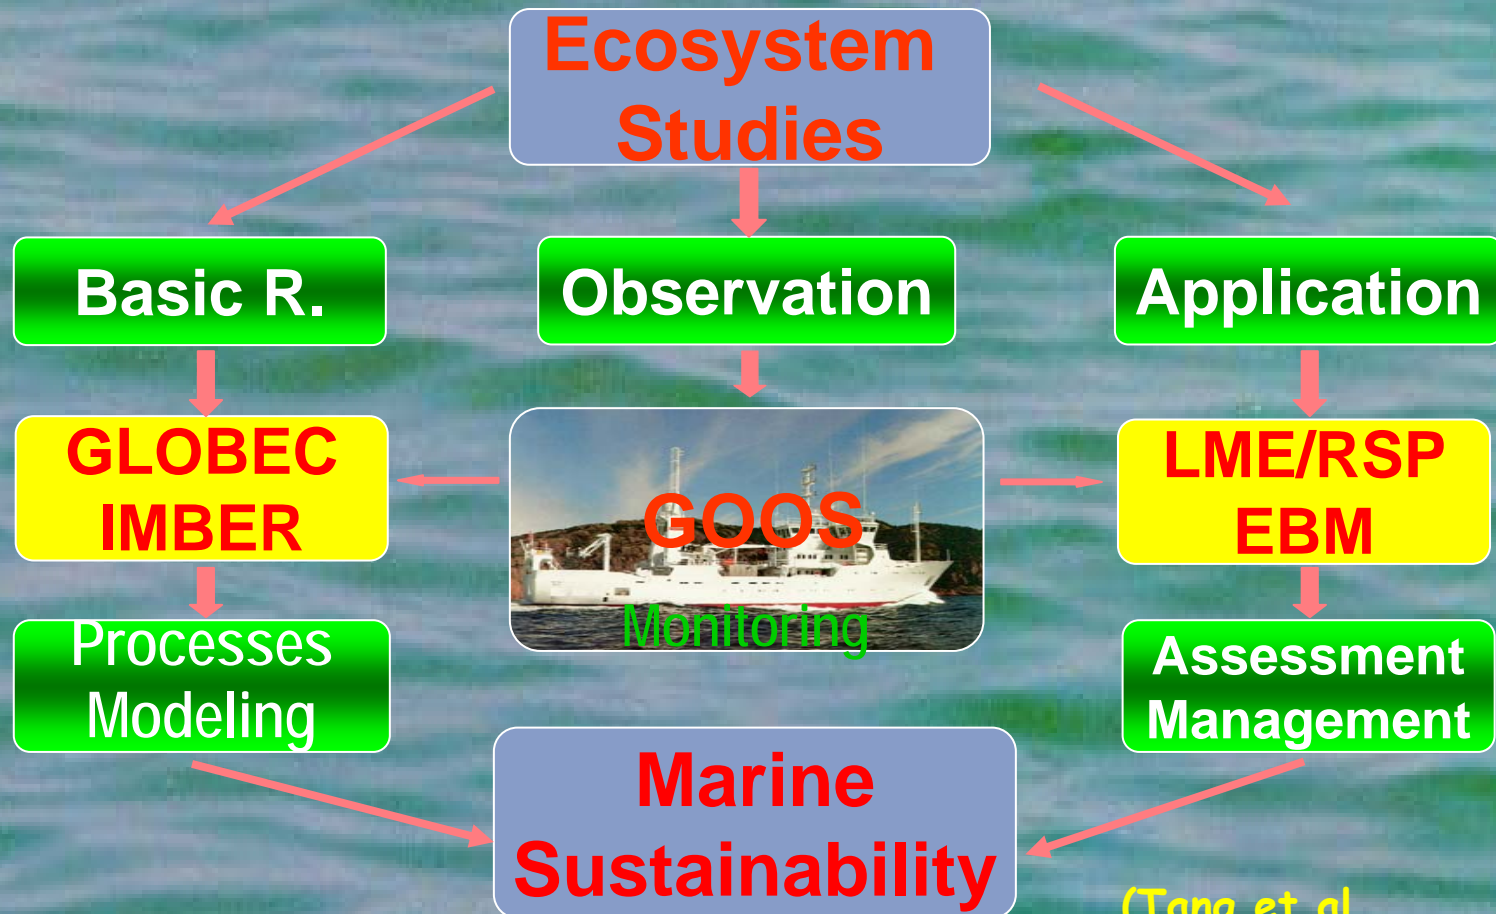

(Based on a analysis of integration index, including water quality, primary production, zooplankton producon.

**Low oxygen area
in the East China Sea and the Yellow Sea**

Future Actions:

Establish a ecosystem-based monitoring, assessment and process-oriented studies Program.

(Tang et al.,
1995, 2000, 2003)

- **Monitoring and assessing the changing states and health of the ecosystem is a scientifically based strategy.**

--- The YSLME Project “Reducing Environmental Stress in the Yellow Sea Large Marine Ecosystem”, 2005-2009, GEF funding support .

□ Planning for the Co-operative Study Cruises:

- Provide basin-wide data and information for all components;
- Provide data and information that will be used, together with other existing data and information, in the preparation of the TDA; and
- Prepare necessary baselines of the status of the Yellow Sea environment at start of project implementation.

-
- The background is a collage of various images related to the ocean and environment. It includes a large iceberg floating in the sea, two research ships (one red and white, one white), penguins on an ice floe, a seagull in flight, and a large school of fish swimming underwater. There are also smaller images of marine life like jellyfish and a satellite in the upper left.
- A comprehensive process-oriented study of ecosystem service and goods should be considered also, in order to understand the interactions among the important biological, chemical and physical characteristics of the Yellow Sea LME, and further increase the predictive capability of resource managers.

Ecosystem Studies in the coastal ocean of China

- ❑ **China-GLOBEC I:** Ecosystem Dynamics and Sustainable utilization of Marine Living Resources in the Bohai Sea , 1997-2000; Budget: US\$ 0.6 Million.
- ❑ **China-GLOBEC II:** Ecosystem Dynamics and Sustainable utilization of Marine Living Resources in the East China Sea and Yellow Sea , 1999-2004; Budget: US\$ 4.5 Million.
- ❑ **China-GLOBEC III /IMBER I:** Key Processes and Sustainable Mechanisms of Ecosystem Food Production in the Coastal Ocean of China, 2006-2010; Budget: US\$ 4. Million.

Chief Scientist: Qisheng Tang (ysfri@public.qd.sd.cn)

China-GLOBEC III /IMBER I focus on function (ecosystem service and goods) and integration (between biogeochemistry processes and food webs (from end to end)) studies.

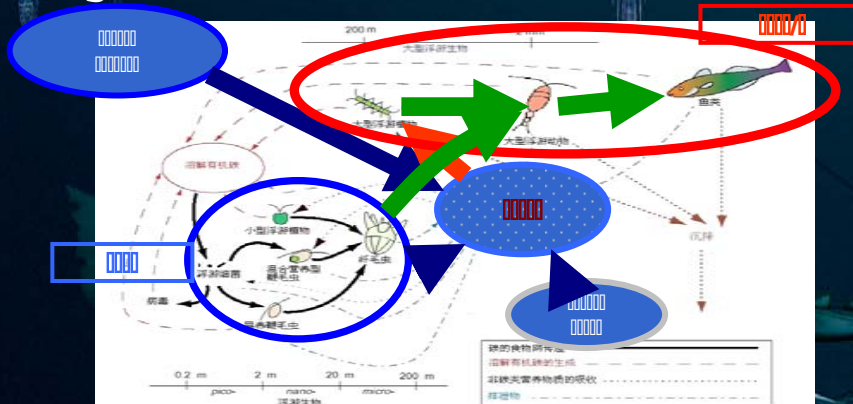

KSQ 1: Supporting role of main biogeochemical processes in food production

KSQ 2: Key physical processes of biogenic element cycle and supplement

KSQ 3: processes Primary production coupling with main biogeochemical

KSQ 4: Food production processes of biological function groups together with their sustainable models

First Announcement

The Second Global Conference on
LMEs will be held in Qingdao, China
on September 11-13, 2007

Convener:

Dr. Kenneth Sherman and Prof. Qisheng Tang

Thank You

2004 1 22

Management Implication

- Key scientific points:

- ✓ Ecosystem-based approach

- ✓ The Yellow Sea is

semi-enclosed shelf sea;

heavy exploitation area;

changing states of ecosystem resources.

Management implication

- Reversing the decline of their marine ecosystems,
- Restoring the depleted biomass of food fish for sustaining growing populations of coastal communities, and
- Conserving the integrity of highly fluctuating ecosystems to ensure continued benefits for future generations.

One inference:

Negative relationship between ecological conversion efficiency and trophic level in the Yellow Sea ecosystem (Tang et al., xxxx).

Low TL with higher ECE; high TL with lower ECE.
(High ECE: 0.32-0.43; medium ECE: 0.23-0.26; low ECE: 0.13-0.15)

LH: rednose anchovy, sand lance, gizzard shad and finespot goby.

HL: red eabream, black porgy, tiger puffer, fat greenling and halfbeak.

???: black rockfish, chub mackerel.

ecological efficiency in the same trophic levels would increase.

**It may be an adaptive response to a forced ecosystem !
It may be a new challenge to fisheries management also !**
